**FOR IMMEDIATE RELEASE**

### **AI Platinum Elite High Definition Entertainment Line – *The Sky is the Limit***

Little Rock, AR, June 1, 2009 — DeCrane Aerospace Audio International (DAAI) has launched the ***AI Platinum Elite High Definition System*** for customer delivery in Q1 of 2010. The High Definition system provides Full 1080p resolution via high-speed 3G-SDI over CAN bus architecture.

Through use of aircraft-standard video coaxial cable and connections the system optimizes the ease, cost and overall weight of aircraft installations. The AI Platinum Elite system distributes uncompressed 3G-SDI High Definition video signal to create theater-quality video that is unaffected by system latency, synchronization issues and 400 Hz signal interference that is inherent to other entertainment systems.

Audio International has developed a Blu-Ray Player and a wide array of High Definition LCD Monitors for the AI Platinum configuration. The system is designed with in-system programming that offers the capability to plug into a system port for software downloads. Additional features include and built-in system self test, as well as remote diagnostic analysis for field-service applications.

“We continue as the most innovative CMS/IFE provider in the industry,” stated General Manager Stan Young. “We take enormous pride in bringing to market the top-quality products and services demanded by our industry. The AI Platinum Elite high definition entertainment system is just one more example of Audio International’s leadership into cutting-edge technology.”
